Recent Searches Tracker

By Dharmit Sathvara

Problem Statement

Recent Searches Tracker

Modern websites and search engines store recent search queries to improve user experience. Users often search for the same items multiple times, so maintaining a search history helps them quickly access previous searches.

The objective of this project is to develop a **Recent Searches Tracker using HTML, CSS, and JavaScript** that:

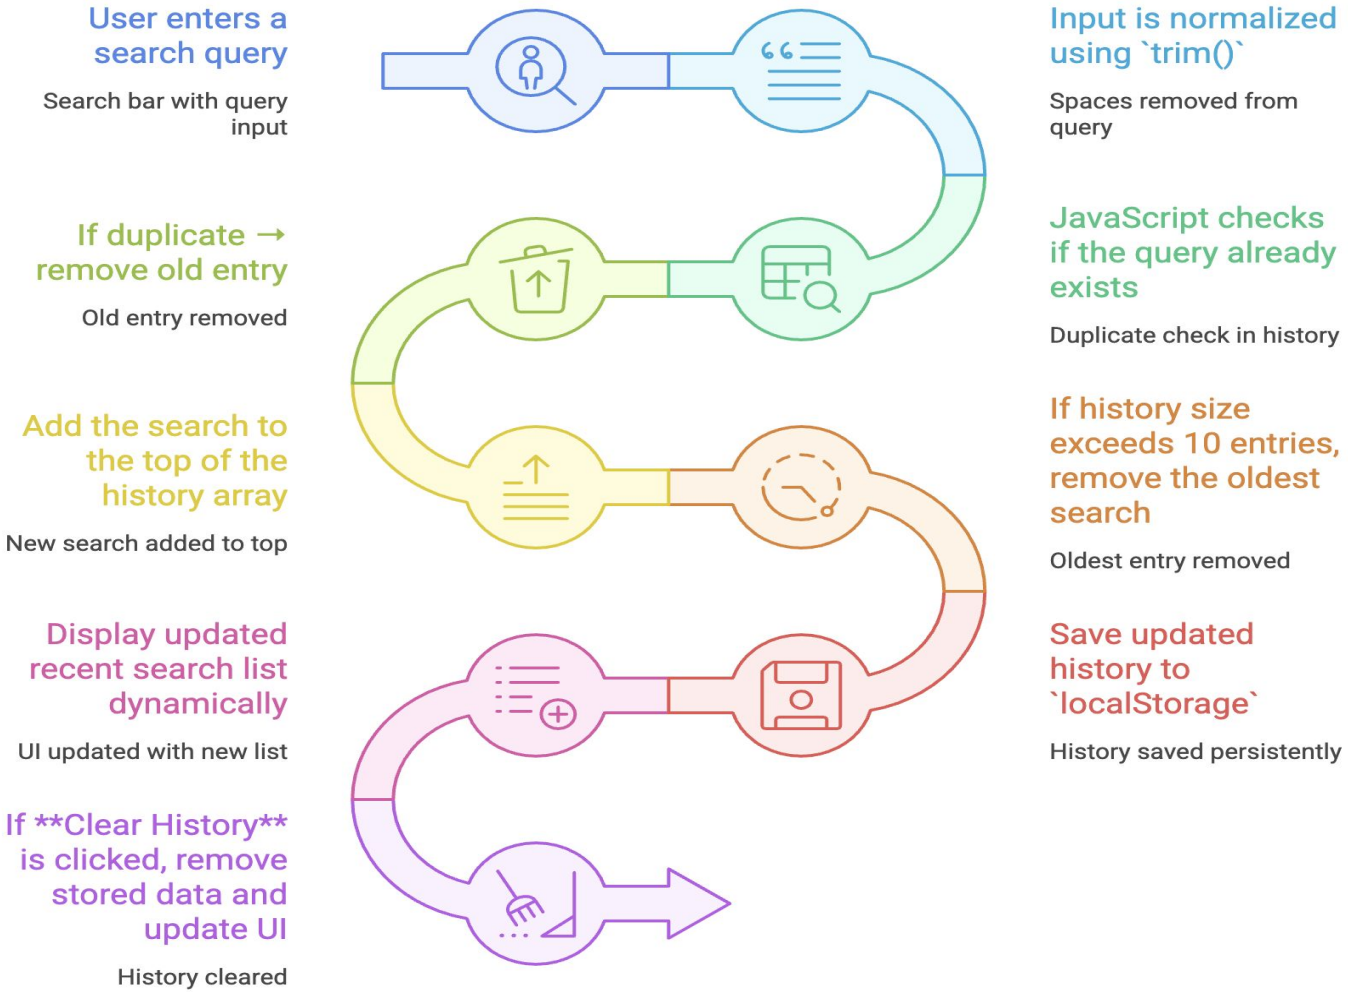
Stores user search queries
Maintains **only unique searches**
Limits the search history to **10 entries**
Saves the data using **browser localStorage**
Provides a **Clear History** option

Solution

Features implemented:

- **Search input field** for entering queries
- **Recent search list** displayed on the page
- **JavaScript array** to manage search history
- **Duplicate removal logic** to keep searches unique
- **Limit of 10 searches** to maintain bounded memory
- **localStorage integration** to store data even after refresh
- **Clear History button** to remove all stored searches

Working Method



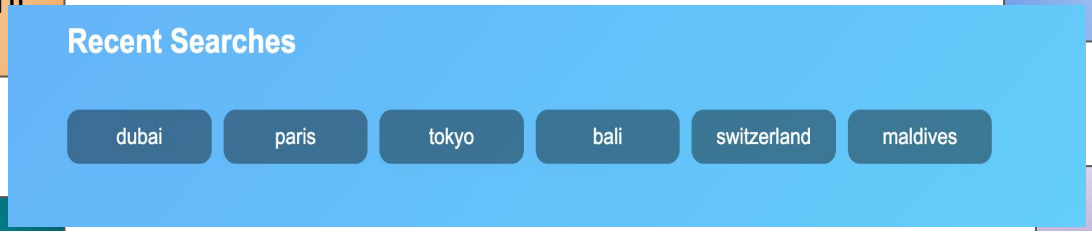
Conclusion

Recent Searches Tracker successfully demonstrates how JavaScript can manage user search history efficiently.

Key Outcome of the Recent Search Tracker

State Management using arrays,DOM manipulation and event handling

Used Local Storage for browser persistence



Maintained unique and limit search history

Built a clean and responsive UI with animations
